Zcytor2, which shares homology with cytckine receptors and was isolated from human placental poly4+ RNA. The resulting polypeptide is a receptor for cytckines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or inferentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in

ö
allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.
                                                                                                                                                                                                                                                                                                                                                                       HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                     This protein comprises a novel human cytokine/peptide hormone receptor, designated the HR-1 receptor, that shows 27% identity and 52% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a closure of see AAV04131) obtained from a human testis library. Recombinant HR-1 receptor can be expressed in claimed host cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or campounds which bind to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by AIDS, applastic anaemia, neutropaemia or cytotoxic treatments for cancer. C HR-1 antagonists, e.g. antibodies or HR-1 receptor fragments, can be used to treat conditions associated with HR-1 receptor

C overexpression. The antibodies can also be used to determine HR-1 receptor levels, since overexpression may be diagnostic of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SSWAETTYWISPQGIPETKVQDMDCVYYNWQYLLCSWKPGIGVLLDTNYNLFYWYEGLDH 180

```
This protein comprises a novel human cytokine/peptide hormone receptor, designated HR-1 receptor. The amino acid sequence receptor, designated HR-1 receptor. The amino acid sequence was deduced from a cDNA clone (see AAV04055) isolated from a human testis cDNA library. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are polyneptides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, an autibody against the polypeptide, an autibody against the polypeptide, an candagonist that inhibits the activity of the polypeptide, a process for diagnosing a disease, or a susceptibility to disease, related to expression of HR-1 receptor. And amethod for identifying compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, compounds that activate or inhibit the HR-1 receptor. HR-1 receptor and gene) therapy applications, e.g. to increase resistance to infections in individuals with trauma and/or burns, and to prevent, ameliorate, treat, diagnose and/or determine themsetopolesis induced by AIDS, aplastic anaemia, congenital or cyclic neutropaemia and/or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of the human cytokine/peptide hormone receptor (HR-1 receptor). This, or it's activators or agonists, can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by acquired immune deficiency syndrome (ALDS), aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. Antagonists of the receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overexpression of the HR-1 receptor, e.g. those listed above. Antibodies may also be used to assay levels of HR-1 receptor, overexpression of which may be diagnostic of tumours, by usual

Since IL-13 inhibits macrophage activation, IL-13bc proteins can also be used to enhance macrophage activation, e.g. in vaccination, treatment of mycobacterial or intracellular organisms or parasite infections. IL-13bc proteins may also be used to potentiate the effects of IL-13 in vitro and in vivo, as diagnostic agents, and to screen for agents capable of binding to IL-13bc or IL-13 receptor, or which interfere with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      which IL-13 is implicated, particularly IgE-mediated conditions and diseases including atopy, allergy, asthma, immune complex diseases (e.g. lupus, nephrotic syndrome, nephritis, glomerulonephritis, thyroiditis and Grave's disease), lung inflammation, immunodeficiency, and cancer. Since IL-13 inhibits macrophage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of the interleukin-13 binding chain (IL-13bc) of the human IL-13 receptor, as deduced from an isolated human testis cDNA clone (see AAA77912). IL-13bc is a member of the haematopoietin receptor family that acts as a mediator of IL-13. The invention provides methods for the recombinant production of IL-13bc polypeptides, including claimed full-length IL-13bc polypeptides, including claimed full-length IL-13bc polypeptides, particularly soluble II-13bc polypeptides, and IL-13bc polypeptides, and IL-13bc polypeptides, or inhibitors (e.g. antagonists of the interaction of IL-13 and its receptor) can be used to treat conditions in
                                                                                                                                                                                                                                                                                                                                     Wood C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PVYLIFTRESSCEIKLKWSIPLGPIPARCFDYEIEIREDDITLVTATVENETYTLKTTNE

                                        as liver, skin epidermis and endodermis, muscle, tendon, cartilage, cardiac tissue, pancras, lung, uterine tissue, neural tissue, pancras, lung, uterine tissue, neural tissue, biliary cact and gut. It is also used in the treatment or modulation of various IL-13 related conditions such as allergic conditions, The present sequence is human interleukh (IL)-13 binding chain of IL-13 receptor (IL-13bc). IL-13bc protein is used to potentiate the effects of IL-13. This protein is also used to enhance macrophage activation and hence can be used in vaccination or treatment of mycobacterial or parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300

(IL-13) antagonist or an IL-4 antagonist. In particular, the IL-13 antagonist is the IL-13 binding chain (IL-13bc, AM292947, AM292948) of the IL-13 receptor (IL-13R), or soluble fragments thereof. The method is useful for treating or inhibiting the formation of tissue fibrosis resulting from the healing of a wound, including a surgical incision wound, or from infection with schistosoma. The method may be used to treat fibrosis in a variety of tissues, particularly liver tissue, but also skin epidermis, skin endodermis, muscle, tendon, cartilage, cardiac tissue, pancreatic tissue, lung tissue, uner tissue, mural tissue, testis, ovary, adrenal gland, artery, vein, colon, small intestine, biliary tract or gut tissue. The present sequence represents human IL-13bc.

The resulting polypeptide is a receptor for testis cDNA library. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or infertility. Antagonists of this receptor may be used to characterise infertility. Antagonists of this receptor may be used to characterise infertility. Antagonists of this receptor may be used to characterise infertility and also full interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and is isolated from testifs tissue obtained from a Celebus macaque. The resulting polypeptide is a receptor for cytokines (particular language. The resulting polypeptide is a receptor for cytokines (particular cells, probably being involved in spermatogenesis. It can be used to detect ligands promoting proliferation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.

                The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

The present sequence represents the murine interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known blological activities of IL-13. Recombinant
IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to the treat Ing-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephritis, thyroiditis and Grave's disease.
They are also used to treat immune deficiency (particularly in hemmatopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor other than IL-13bc. IL-13bc rain also be used in diagnosis to detect expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

The present sequence is that of the interleukin-13 binding chain (IL-13bc) of the murine IL-13 receptor, as deduced from an isolated (IL-13bc) of the murine IL-13 receptor, as deduced from an isolated of 374/Hal mouse thymus ConA clone (see AAA7911). IL-13bc is a member of the heamatopoietin receptor family that acts as a mediator of IL-13. The invention provides methods for the recombinant of production of IL-13bc polypeptides, including claimed full-length IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, of IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, of IL-13b and its receptor inhibitors (e.g. antagonists of the interaction of IL-13 and its receptor) can be used to treat conditions and diseases including atopy, alterny lgE-mediated conditions and diseases including atopy, alterny, asthma, immune complex diseases thyroiditis and Grave's disease, lung inflammation, thyroiditis and Grave's disease, lung inflammation, IL-13bc proteins can also be used to enhance macrophage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide encoding an interleukin-13 (IL-13) binding chain of an IL-13 receptor for treating IgE-mediated conditions, such as atopy, asthma, Grave's disease and inflammatory conditions of the lung -

This sequence represents interleukin-13 (IL-13) beta receptor. The invention relates to new purified peptides comprising 380 or 427 amino acid sequences, which are receptors for interleukin-13 (IL-13); the 380 and 427 am proteins are designated IL-138 beta and alpha respectively. The IL-13R beta has high affinity beta and alpha are used as afignostic probes to identify aberrant synthesis or genetic anomalies comparing probes to identify aberrant synthesis or genetic anomalies such as loss of heterozyosity and rearrangements, or chromosomal anomalies. They are also used for production of recombinant IL-13R beta and alpha which can be used so IL-13 antagonists, specifically to requlate IL-13 induced responses for treatment of inflammation and relargy. II-13 receptors are also useful as antisense molecules for gene therapy (blocking synthesis of IL-13R). Antibodies are used (in standard immunassays) to diagnose diseases associated with abnormal expression of IL-13 receptors: when coupled to a toxin also for treatment of inmunassays) to diagnose diseases associated with abnormal expression of IL-13R. Cells that express IL-13R at the surface are used to identify ligands and modulators of IL-13R. Note: IL-13R beta is encoded by the nucleic acid sequence shown in Figure 2a in the sequence listing (AAT86828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Interleukin-13; IL-13; interleukin-13 receptor binding chain; IL-13bc; mediator; IL-13 receptor binding inhibition; IgE-mediated condition; allergy; asthma; immune complex disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SSWAETTYWISPQGIPETKVQDMDCVYYNWQYLLCSWKPGIGVLLDTNYNLFYWYEGLDH 180

The present sequence represents the human interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts a completed to the known biological activities of IL-13bc. IL-13bc acts a completed to the known biological activities of IL-13bc. Recombinant inhibit the binding of IL-13 to its receptor. They are particularly used to treat 1gp.mediated conditions, e.g. allergy, asthma and immune complex consorted progenitor of the inhibit the binding of IL-13 to pertain and immune complex they are also used to treat immune deficiency (particularly in heart operation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor content than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HFKECTVEYELKYRNIGSETWKTIITKNLHYKDGFDLNKGIEAKIHTLLPWQCTNGSEVQ 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and was isolated from human placental polly4* RNA. The resulting pollypeptide is a receptor for placental polly4* RNA. The resulting pollypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise infertility. Antagonists of this receptor antagonists and ilgand-binding this receptor can also be used to modulate immune function, e.g. in blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allery and asthma, as a diagnostic to determine circulating levels of assay circulating receptor (an abnormal level may be indicative of diseases such as cancer), for labelling cells that express the receptor,

             receptor, designated the HR-1 receptor, that shows 27% identity and 57% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a cDNA clone (see AAV04131) obtained from a human testis library. Recombinant HR-1 receptor can be expressed in claimed host cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoletic disorders, e.g. where induced by AIDS, aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. HR-1 antagonists, e.g. antibodies or HR-1 receptor fragments, can be used to creat conditions associated with HR-1 receptor conditions associated with HR-1 receptor conditions. The antibodies can also be used to determine HR-1 receptor levels, since overexpression may be diagnostic of tumours.

This protein comprises a novel human cytokine/peptide hormone receptor, designated HR-1 receptor. The amino acid sequence was deduced from a cDNA clone (see AAVO4075) isolated from a human testis cDNA library. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are solynclectides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, an argonist that inhibits the activity of the polypeptide, a process or diagnosing a disease, or a susceptibility to disease, related to expression of HR-1 receptor, and a method for identifying compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, increase resistance to infections in individuals with trauma and/or burns, and to prevent, ameliorate, treat, diagnose and/or determine the proposition to asthma, allergic disorders or disorders of haematopoiesis induced by AIDS, aplastic anaemia, congenital or cyclic neutropaemia and/or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121 SSWAETTYWISPQGIPETKVQDMDCVYYNWQYLLCSWKPGIGVLLDTNYNLFYWYEGLDH 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of the human cytokine/peptide hormone receptor (HR-1 receptor). This, or it's activators or agonists, can be used to inteat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. Antagonists of the receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overaxpression of the HR-1 receptor, e.g. those listed above. Antibodies may also be used to assay levels of HR-1 receptor, overexpression of which may be diagnostic of tumours, by usual immunoassays; to isolate and identify HR-1 receptor-expressing cells; or for affinity purification of the HR-1 receptor-expressing cells; or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SSWAETTYWISPQGIPETKVQDMDCVYYNWQYLLCSWKPGIGVLLDTNYNLFYWYEGLDH 180

human testis cDNA clone (see AAAZ7912). IL-13bc is a member of the heamatopoietin receptor family that acts as a mediator of the heamatopoietin receptor family that acts as a mediator of the heamatopoietin receptor family that acts as a mediator of IL-13D polypeptides, including claimed full-length production of IL-13D polypeptides, including claimed full-length in-13bc, its extracellular domain, and its intracellular domain.

IL-13Dc polypeptides, particularly soluble IL-13bc polypeptides, and IL-13 receptor inhibitors (e.g. autagonists of the interaction which IL-13 and its receptor) can be used to treat conditions and diseases including atopy, altergy, asthma, immune complex diseases of IL-13 and drave's disease, hung inflammation, thyroidits and crave's disease, hung inflammation, immunodeficiency, and cancer. Since IL-13 inhibits macrophage activation, IL-13Dc proteins can also be used to enhance macrophage activation, IL-13Dc proteins can also be used to enhance macrophage activation, e.g. in vaccination, treatment of mycobacterial or intracellular organisms or parasite infections. IL-13Dc proteins in vivo as diagnostic agents, and to screen for agents capable of binding to IL-13Dc or IL-13 receptor, or which interfere with the
(IL-13bc) of the human IL-13 receptor, as deduced from an isolated

The invention relates to a method of treating, or inhibiting the formation of tissue fibrosis in mammals, which involves administering a pharmaceutical composition comprising interleukin (IL)-13 antagonist. The protein of the invention is useful for treating tissue fibrosis resulting from infection with Schistosoma or from healing of a wound which is a surgical incision, or inhibiting formation of tissue fibrosis which affects tissues such as liver, skin epidermis and endodermis, muscle, tendon, cartilage, cardiac tissue, pancreas, lung, uterine tissue, neural tissue, billary tract and gut. It is also used in the treatment or modulation of various IL-13 related conditions such as allergic conditions, of various IL-13 related conditions such as allergic conditions.

The present sequence is human interleukin (II)-13 content is used to binding chain of IL-13. This protein is also used to enterment the effects of IL-13. This protein is also used to enterment the effects of IL-13. This protein is also used to enterment.
                                                                                                                                                    this region is specifically and 23e"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           by administering an interleukin-13 (IL-13) antagonist or an IL-4 antagonist. In particular, the IL-13 antagonist is the IL-13 binding chain (IL-13bc; AAB29747, AAB29748) of the IL-13 receptor (IL-13R), or soluble fragments thereof. The method is useful for treating or inhibiting the formation of tissue fibrosis resulting from the healing of a wound, including a surgical incision wound, or from infection with schistusce, particularly liver tissue, but also skin epidermis, skin endodermis, muscle, tendon, cartilage, cardiac tissue, pancreatic tissue, nearing tissue, interine tissue, nearl tissue, testis, ovary, adrenal gland, artery, vein, colon, small intestine, biliary tract or gut tissue. The present sequence represents human IL-13bc.

The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface
                                                                                                                                                                                                         SSWAETTYWISPQGIPETKVQDMDCVYYNWQYLLCSWKPGIGVLLDTNYNLFYWYEGLDH 180

ö
of testicular cells, probably being involved in spermatogenesis. It can differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allery and asthma, as a diagnostic to determine circulating levels of sassay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.

                                                                                                                    The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.
                                                                                                                                                                                                                                                                                                                                                                                                    CFDYEIEIREDDTTLVTATVENETYTLKTTNETRQLCFVVRSKVNIYCSDDGIWSEWSDK 328

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                   ö
                                                                                                               The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and is isolated from testis tissue obtained from a Celebus macaque. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is polypeptide expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands promoting proliferation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents the murine interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13bc. IL-13bc acts a IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat igg-mediated conditions, e.g. allergy, asthma and immune complex context igg-mediated conditions, e.g. allergy, asthma and immune complex context specially lupus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in haematopoletic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor context than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ñ

The present sequence is that of the interleukin-13 binding chain (IL-13bc) of the murine IL-13 receptor, as deduced from an isolated (IL-13bc) of the murine IL-13 receptor, as deduced from an isolated of 134/Heb mouse thymus coln (see AAA27911). IL-13bc is a member of the haematopoietin receptor family that acts as a mediator of IL-13. The invention provides methods for the recombinant production of IL-13bc polypeptides, including claimed full-length IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, and IL-13b receptor inhibitors (e.g. antagonists of the interaction of IL-13 and its receptor) can be used to treat conditions and IL-13 and its receptor) can be used to treat conditions and IL-13 and its receptor) can be used to reat conditions of ilseases including atopy, allergy, asthma, immune complex diseases including atopy, allergy, asthma, immune complex diseases including atopy, allergy, asthma, immune complex diseases in immunedeficiency, and cancer. Since IL-13 inhibits macrophage activation, e.g. in vaccination, treatment of mycobacterial or intracellular organisms or parasite infections. IL-13bc proteins in vivo, as diagnostic agents, and to screen for agents capable of binding to IL-13bc oits receptor. or which interfere with the
                                                                     New polynucleotide encoding an interleukin-13 (IL-13) binding chain of an IL-13 receptor for treating IgE-mediated conditions, such as atopy, asthma, Grave's disease and inflammatory conditions of the lung -
                                                                                                                                                                       Claim 11(a); Page 50-51; 60pp; English

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
ILSUE SPECIFICITY: SPLEEN, LIVER, THYMUS, HEART, LUNG, KIDNEY,
TESTIS, STOMACH, BRAIN, SKIN, AND COLON; BUT NOT SKELETAL MUSCLE.
SIMILARITY: CONTAINS I IMMUNOSLOBULIN-LIKE C2-TYPE DOMAIN.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

ALPHA CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS AN ALTERNATE ACCESSORY PROTEIN TO THE COMMON CYTOKINE RECEPTOR GAMAA.

CHAIN POR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF GAMAA-C. IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY.

CHAIN POR IL-4 SIGNALING, BUT CANNOT REPLACE OF IL4R-ALPHA,

LIJR-ALPHA, AND POSSIBLY OFFIER COMONENTS.

CHAIN THERELOWAND TYPE I MEMBRANE PROTEIN.

CHAIN THERELOWAND TYPE I MEMBRANE PROTEIN.

CHAIN TASSUE SPECIFICITY: UBIOUITOUS, HICHEST LEVELS IN BRAIN, LUNG AND SKELETAL MUSCLE AND OVARY; LOWEST LEVELS AND BNOTHEILAL CELLS.

CHAIN THERELOWAND IN B-CELLS, T-CELLS, AND ENDOTHEILAL CELLS.

CHAIN THERELOWAND I PIBRONECTIN TYPE III-LIKE DOMAIN.

CHAIN THERELOWAND I PIBRONECTIN TYPE III-LIKE DOMAIN.
